Group Travel Expense Simplification Engine

Agile Backlog Creation & Sprint Simulation in Jira

PES2UG24CS103 | B Meghana

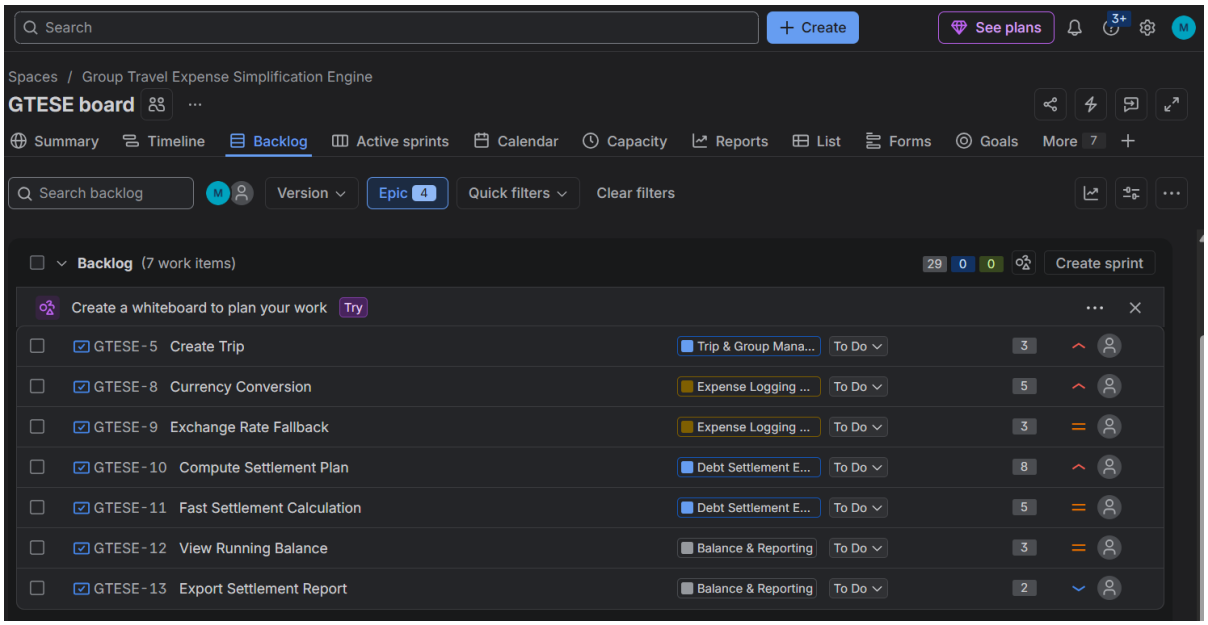

1. Jira Backlog with Epics and User Stories

The Jira backlog for the GTESE project shows all work items organized under their parent Epics, with priority, status, and estimate columns visible for each User Story.

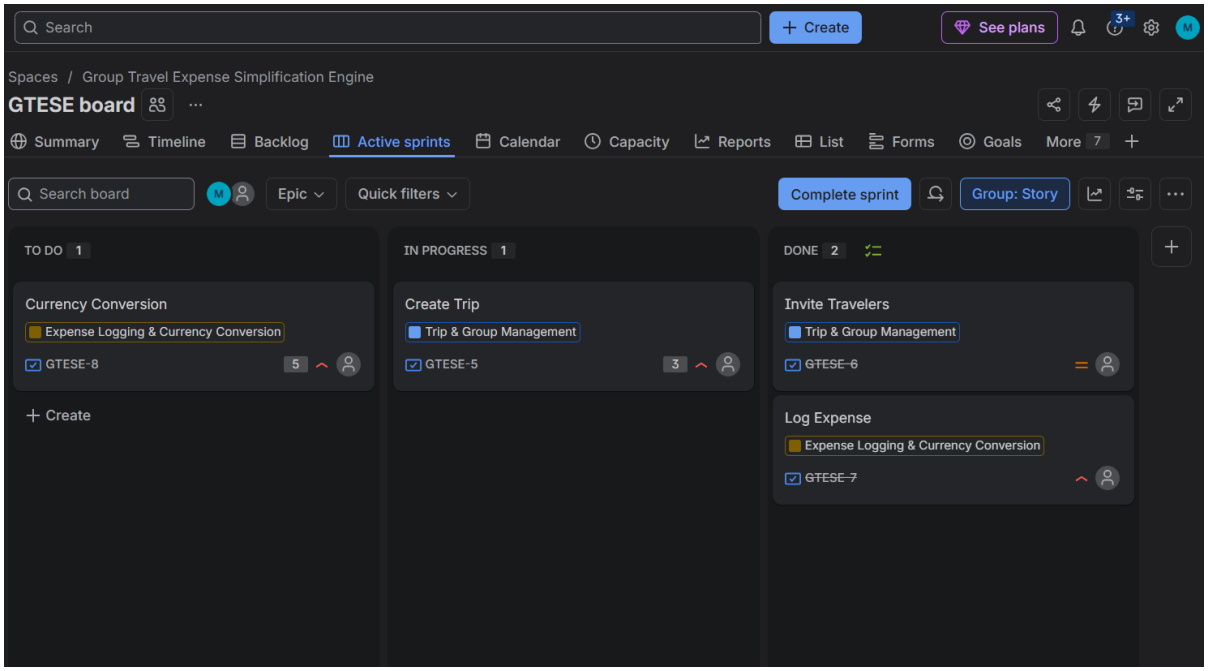

2. Story Point Assignments

Story points were assigned on a relative Fibonacci scale based on complexity, effort, and uncertainty. Simpler stories such as Export Settlement Report and Exchange Rate Fallback received lower estimates, while stories involving core algorithmic work — such as Compute Settlement Plan and Currency Conversion — were given higher estimates to reflect their greater complexity and risk.

3. Sprint Board – Active Sprint View

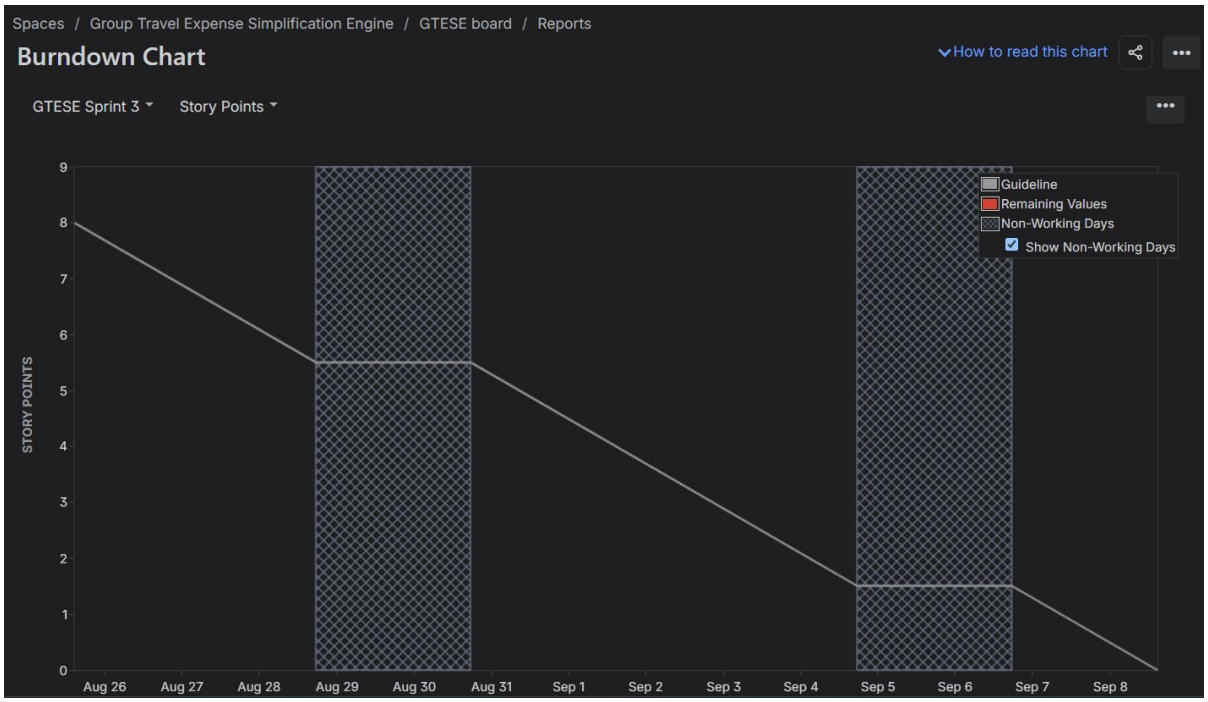

The sprint was simulated using the standard Jira workflow: To Do → In Progress → Done. The board below shows Currency Conversion still in To Do, Create Trip in progress, and Invite Travelers and Log Expense completed.

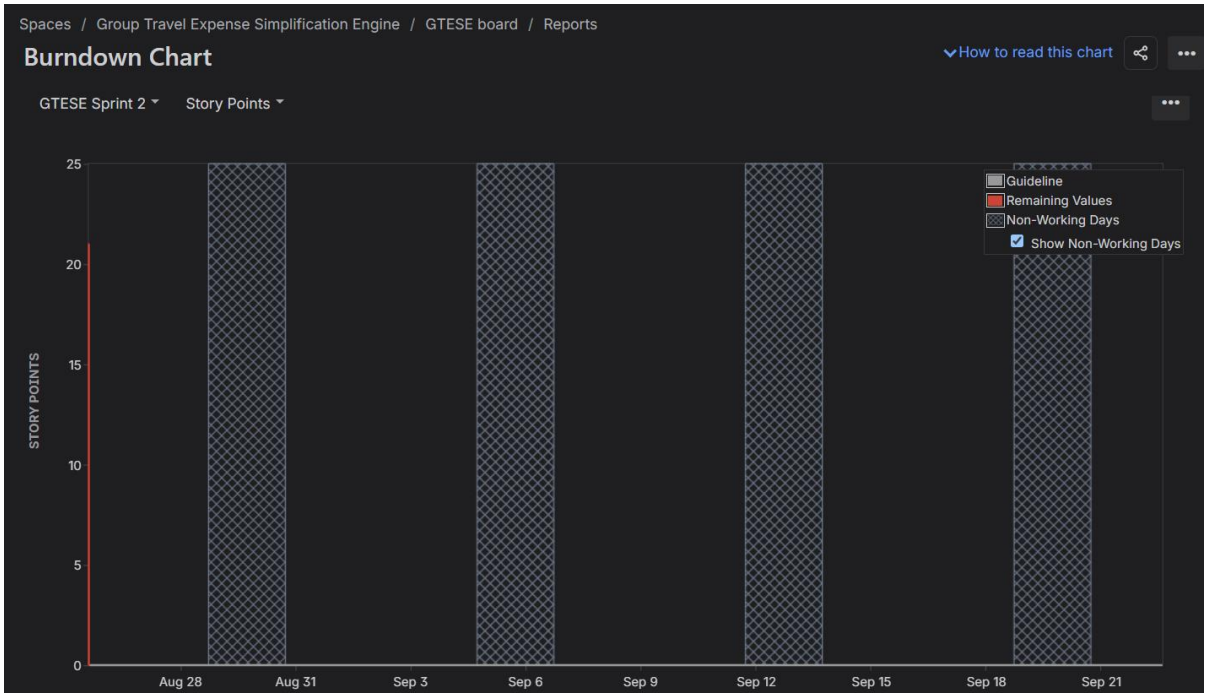

4. Burndown Charts

The burndown chart tracks remaining story-point work against the ideal guideline burn rate across each sprint window. Charts for GTESE Sprint 2 and GTESE Sprint 3 are shown below.

SPRINT-1 - (GTESE-5,6,7,8)

SPRINT-2 - (GTESE-9,10,11,12,13)

5. Reflection Questions

1. Did your estimations reflect the actual effort?

The story point estimates were broadly reasonable for the simulated sprints. Simpler, well-understood stories like Invite Travelers and Export Settlement Report were given lower points (2–3), while stories with more algorithmic complexity and external dependencies — such as Compute Settlement Plan (min-flow settlement logic) and Currency Conversion (live exchange-rate integration) — were given higher points (5–8). Since this was a simulated single-person sprint, the estimates were most useful as a relative comparison of effort rather than a precise time forecast.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized around dependency order: Trip & Group Management and Expense Logging & Currency Conversion were marked High priority since the Debt Settlement Engine depends on trips, participants, and converted expense data already existing. Balance & Reporting stories were kept Medium/Low since they surface information derived from the other epics rather than generating it.

3. How did your simulated sprint align with your plan?

The sprint pulled in the foundational stories first — Create Trip, Invite Travelers, Log Expense, and Currency Conversion — and moved them through To Do → In Progress → Done on the active sprint board. This matched the intended plan of establishing trip setup and expense capture before later sprints tackle the settlement engine and reporting stories.

4. What insights did the burndown chart give about your team's capacity?

The burndown charts show how much story-point work remained in each sprint window relative to the ideal guideline line. Because this was a single-person simulation rather than a real multi-person team, the charts were most useful for visualizing how the remaining workload was distributed across sprints, and for confirming that later sprints (Sprint 2 and Sprint 3) still carried the bulk of the Debt Settlement Engine and Balance & Reporting work.
